Technical Overview

The PA-699 range of differential pressure transmitters incorporates a proved ceramic fulcrum lever technology. They deliver calibrated, temperature-compensated sensor signals, available as standard voltage or current outputs.

They are ideal for registering low air flow in air conditioning systems and for the measurement of fine pressures in environmental, laboratory and clean room application (air and non-corrosive gases).

Installation

Antistatic precautions must be observed when handling these sensors. The PCB contains circuitry that can be damaged by static discharge.

1. Mount the unit onto the duct or wall by drilling two holes at 80mm centres and fix with self-tapping pan head screws.
2. Push the pressure tubing onto the pressure ports on the unit. Ensure that the Hi and Lo ports have been correctly identified (P1 High, P2 Low).
3. Undo screw on hinged lid, pass cable through the cable gland PG11 and make connections as required.

The PA-699 will be damaged if subjected to excessive pressure. Do NOT test the unit by blowing into the inlet ports.

- The recommended installation position is vertical, with the pressure connections facing downwards (factory calibration).

- With the unit mounted horizontally, cover facing downward this will affect the signal by approximately 10Pa higher than the actual pressure.

- With the unit mounted horizontally, cover facing upward this will affect the signal by approximately 10Pa lower than the actual pressure.
